C. Species: avian leukosis virus, ALV.

C. Species: avian leukosis virus, ALV.

C. Spate: 31-Dec-1991 #sequence_revision 31-Dec-1991 #text_change 11-Jun-1999

C. Accession: B00643; A00643

R. Nilsen, T. W. Maroney, P. A.; Goodwin, R.G.; Rottman, F.M.; Crittenden, L.B.; Raines, M. Cell 41, 719-726, 1985

A; Fitle: c-erbB activation in ALV-induced erythroblastosis: novel RNA processing and prodession: B00643; MUID:85228222; PMID:2988784

A; Reference number: A00643; MUID:85228222; PMID:2988784

A; Recession: B00643

A; Molecule type: mRNA

A; Residues: 1-698 «NLL.

A; Cross-references: GB:MIO066; GB:MI3881; NID:9211749; PIDN:AAA48763.1; PID:9211750

A; Note: in Genbank entry CHKERBBF, release 109.0, the source is designated as Gallus gal C; Comment: This protein is synthesized as a gag-env-erbB protein.

C; Genetics:

A; Gene: gag-env-erbB

C; Superfamily: epidermal growth factor receptor; protein kinase homology

C; Keywords: ATP; oncogene; phosphotransferase; transforming protein; tyrosine-specific profession: protein (fragment) #status predicted <AGAG.

F; 0-6) Product: gag protein (fragment) #status predicted <AGAG.

F; 0-698 / Product: gag protein tyrosine kinase erbB #status predicted <AGAG.

F; 0-698 / Product: protein kinase homology kKINs.

F; 10-7-89 / Region: protein kinase ATP-binding motif
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 gal

Gene 140:231-255(1994).

-!- FUNCTION: ESSENTIAL COMPONENT OF A NEUREGULIN-RECEPTOR COMPLEX,

ALTHOUGHT NEUREGULINS DO NOT INTERACT MITH IT ALONE. GP30 IS A

POTENTIAL LIGAND FOR THIS RECEPTOR. NOT ACTIVATED BY EGF, TGF-

C.-- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein

tyrosine phosphate.

C.-- SUBMURT: HETERODIMER WITH EACH OF THE OTHER ERBB RECEPTORS
                                                                                                                                                                                                                                                                                                                                                                                                                                                EDDDMGDLVDAEEYLVPQQGFFSPDPTPGTGSTAHRRHRSSSTRSGGGELTLGLEPSEEG

Rev. Biochem. 56:881-914(1987).

-!- FUNCTION: Receptor for EGF, but also for other members of the EGF family, as TGF-alpha, amphiregulin, betacellulin, heparin-binding EGF-like growth factor, GPJO and vaccinia virus growth factor. Is involved in the control of cell growth and differentiation.

-!- FUNCTION: Isoform 2/truncated isoform may act as an antagonist.
-!- CATALXTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
                                                                                                                                                                                                                                                                                                                                                                                       Sato C., Kim J.-H., Abe Y., Saito K., Yokoyama S., Kohda D.; "Characterization of the N-oligosaccharides attached to the atypical Asn-X-Cys sequence of recombinant human epidermal growth factor receptor.";

MISCELLANEOUS: Binding of EGF to the receptor leads to dimerization, incernalization of the EGF-receptor complex, induction of the tyrosine kinase activity, stimulation of cell synthesis, and cell proliferation.

SIMILARITY: BELONGS TO THE EGF RECEPTOR FAMILY.
                                                                                                                              tails

                                                                                                                                                        Eisinger D.P., Serrero G.; Submitted (JUL) Serrero G.; Submitted (JUL) 1992) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: THE EGE RECEPTOR MEDIATES THE BIOLOGICAL SIGNAL OF EGF,
-- AND ALSO OF TGF-ALPHA, AMPHIREGULIN, HEPARIN-BINDING EGF, GP30 AND
VACCINIA VIRUS GROWTH FACTOR (BY SIMILARITY).
-!- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
tyrosine phosphare.
                                                                                                                                                                                                                                                                                                                                               -!- SÜBCELLULAR LOCATION: Type I membrane protein.
-!- MISCELLANEOUS: Binding of EGF to the receptor leads to
dimerization, internalization of the EGF-receptor complex,
induction of the tyrosine kinase activity, stimulation of cell DNA
synthesis, and cell proliferation.
-!- SIMILARITY: BELONGS TO THE EGF RECEPTOR FAMILY.
Comparison of EGF receptor sequences as a guide to study the ligand
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PROSITE; PS00107; PROTEIN KINASE ATP; 1.

                                                                                                                                                                                                                                                                              LYCOSINE PHOSPHATE.

-- SUBLUNIT: HOWDINER OF HETERODIMER WITH EACH OF THE OTHER ERBB RECEPTORS (POTENITAL).

-- SUBLUNIT: HOWDINER OR HETERODIMER WITH EACH OF THE OTHER ERBB RECEPTORS (POTENITAL).

--- ALTERNATIVE PRODUCTS: 2 ISOFORMS; JM-A (SHOWN HERE) AND JM-B; ARE PRODUCED BY ALTERNATIVE SPLICING, THE TWO ISOFORMS DIFFER FUNCTIONALLY IN THEIR RESPONSE TO HORBOL ESTER: JM-A IS PROCESSED BUT NOT JM-B. SO, THEY RESPECTIVELY REPRESENT CLEAVABLE AND NONCLEAVABLE FORMS OF THE RECEPTOR. BOTH ISOFORMS ARE EXPRESSED IN CEREBELLUM, BUT ONLY THE JM-B ISOFORM IS EXPRESSED IN THE HEART.

--- TISSUE SPECIFICITY: EXPRESSED AT HIGHEST LEVELS IN BRAIN, HEART, KIDNEY, IN ADDITION TO SKELETAL MUSCLE, PARATHYROID, CERBBLLUM, PITUITARY, SPLEEN, TESTIS AND BREAST. LOWER LEVELS IN THYMUS, LUNG, SALIVARY GLAND, AND PANCREAS.

--- PTM: LIGAND-BINDING INCREASES PHOSPHORYLATION ON TYROSINE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This SWISS-PROT entry is copyright. J. Biol. Chem. 272:26761-26768(1997).

-!- FUNCTION: SPECIFICALLY BINDS AND IS ACTIVATED BY NEUREGULINS, NRG-2, NRG-3, HEPARIN-BINDING EGF-LIKE GROWTH FACTOR, BETACELLUIN AND NTAK. INTERACTION WITH THESE FACTORS INDUCES CELL DIFFERENCIATION.

NOT ACTIVATED BY EGF, TGF-A, AND AMPHIREGULIN.

-!- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RECEPTOR PROTEIN-TYROSINE KINASE ERBB-4. Neurosci. 17:1642-1659(1997).

-!- FUNCTION: SPECIFFCALLY BINDING BGF-LIKE GROWTH FACTOR, BETACELLULIN AND NTAK. INTERACTION WITH THESE FACTORS INDUCES CELL DIFFERENCIATION. NOT ACTIVATED BY EGF, TGF-A, AND AMPHIREGULIN (BY SIMILARITY).

-!- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SUBCELLULAR LOCATION: Type I membrane protein.
TISSUE SPECIFICITY: PREFERENTIALLY EXPRESSED IN THE DEVELOPING
NERVOUS SYSTEM. EXHIBITS DISTINCT AND HIGHLY RECIONALIZED PATTERNS
OF EXPRESSION IN THE ADULT BRAIN, WHERE IT IS MAINLY FOUND IN THE
RETICULAR NUCLEUS OF THE THALLAMUS. VERY LOW LEVELS IN KIDNEY, AND

-! ALTERNATIVE PRODUCTS: TWO FORMS, A LONG TRANSMEMBRANE FORM AND A SHORT SECRETED FORM, EXIST DUE TO ALTERNATIVE SPLICING.
-! TISSUE SPECIFICITY: EPTTHELLAL TISSUES AND BRAIN.
-! DOMAIN: THE CYTOPLASMIC PART OF THE RECEPTOR MAY INTERACT WITH THE SH2 OR SH3 DOMAINS OF MANY SIGNAL-TRANSDUCING PROFISINS.
-! PTM: LIGAND-BINING INCREASES PHOSPHORYLATION ON TYROSINE RESIDUES AND PROMOTES ITS ASSOCIATION WITH THE PRS SUBUNIT OF PHOSPHATILINGSITOLIANS.
-! DISEASE: OVEREXPRESSED IN A SUBSET OF HUMAN MAMMARY TUMORS.
-! SIMILARITY: BELONGS TO THE EGF RECEPTOR FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           R InterPro; IPR000494; EGFR L domain.

SUBCELLULAR LOCATION: Type I membrane protein.
SUBCELLULAR LOCATION: Type I membrane protein.
DOMAIN: THE CYTOPLAENIC PART OF THE RECEPTOR MAY INTERACT WITH THE SH2 OR SH3 DOMAINS OF MANY SIGNAL-TRANSDUCING PROTEINS.
PTH: LIGAND-BINDING INCREASES PHOSPHORYLATION ON TYROSINE RESIDUES AND PROMOTES ITS ASSOCIATION WITH THE P85 SUBUNIT OF PHOSPHATIDYLINOSITOL 3-KIRASE.
SIMILARITY: BELONGS TO THE EGF RECEPTOR FAMILY.
                                                                                                                  Rattus norvegicus (Rat).

TISSUE SPECIFICITY: UBIQUITOUSLY EXPRESSED IN EMBRYOS. IN LARVAE,
UNIFORM EXPRESSION IS SEEN IN WING DISKS, GENITAL DISK, ANLAGEN OF
TESTIS AND OVARY, AND BALN CORTEX. IN EYE-ANTENNA DISK, HICHEST
EXPRESSION IS ANTERIOR TO MORPHOGENETIC FURROW, LEVELS REMAIN HIGH
IN PHOTORECEPTOR PRECURSOR CELLS. THIS PATTERN IS REVERSED IN
POSTERIOR EYE DISK. IN ADULTS EXPRESSION IS HIGH IN BRAIN CORTEX
AND THORACIC AND ABDOMINAL GANGLIA.
SIMILARITY: BELONGS TO THE EGF RECEPTOR FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SEQUENCE OF 1133-1137; 1155-1167 AND 1209-1216 FROM N.A., AND MUTATION

-I- MISCELLANBOUS: THIS PROTEIN IS PRODUCED BY ERYTHROLEUKEMIA CELLS
IN CHICKS WHICH HAVE BEEN INJECTED WITH THE AVIAN LEUKOSIS VIRUS
AND SUBSEQUENTLY DEVELOP LEUKEMIA. THE LEUKEMIAS ARE INDUCED BY
THE INSERTION OF RETROVIRAL PROMOTER ELEMENTS IN OR NEAR THE
C-ERBB GENE, WHICH LEADS TO C-ERBB ACTIVATION.

-I- MISCELLANBOUS: THIS PROTEIN IS SYNTHESIZED AS A GAG-ENV-ERBB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      25.5%; Score 1749.5; DB 1; Length 634;

MISCELLANEOUS: Binding of EGF to the receptor leads to dimerization, internalization of the EGF-receptor complex, induction of the tyrosine kinase activity, stimulation of synthesis, and cell proliferation.
SIMILARITY: BELONGS TO THE EGF RECEPTOR FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         EPIDERMAL GROWTH FACTOR RECEPTOR
